Documentation script installation et configuration SAE S4.Deploi.01

Tristan Petit, Nils Hubert, Toni Rey, Majd El Sebeiti , Vianney Miquel

29 mars 2025

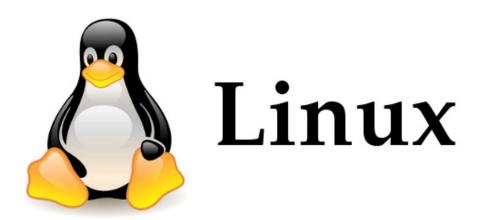

Table des matières

1 Introduction

Dans ce document, nous allons traiter tous les scripts relatifs à l'installation et la configuration de l'infrastructure. Le but est ici, d'automatiser certaines tâches récurrentes comme la configuration DHCP, les ajouts d'utilisateur au système ou au wiki etc...

1.1 Documentation des scripts

Comme dans le document pour les scripts de test, un manuel pour utiliser les scripts ont été intégré au script eux-mêmes. Voici celui du DHCP comme exemple

```
if [[ $# -ne 6 ]];
     then
   cat <<DOC
   Script de configuration du DHCP, ce script utilise kea comme
   Usage :
6
       $0 <interface> <network> <router> <addrDeb> <addrFin> <</pre>
           IpServerDNS >
   Options:
       <interface> : interface sur laquelle on veut configurer
           le serveur ex : eth0
       <network> : adresse Ipv4 du routeur
       <addrDeb> : adresse Ipv4 maximale pour la plage
           allocation adresse
       <addrFin> : adresse Ipv4 minimale pour plage adresse
       <IpServerDNS> : adresse Ipv4 du serveur DNS
   DOC
       exit 1
16
     fi
18
   if ! dpkg -l | grep kea-dhcp4-server &> /dev/null;
```

Listing 1 – documentation script DHCP

2 Script configuration/installation DHCP

```
#!/bin/bash

if [[ $# -ne 6 ]];

then
cat <<DOC
Script de configuration du DHCP, ce script utilise kea comme
DHCP</pre>
```

```
7
   Usage :
       $0 <interface> <network> <router> <addrDeb> <addrFin> <</pre>
9
           IpServerDNS >
10
   Options :
11
       <interface> : interface sur laquelle on veut configurer
           le serveur ex : eth0
       <network> : adresse Ipv4 du routeur
       <addrDeb> : adresse Ipv4 maximale pour la plage
14
           allocation adresse
       <addrfin> : adresse Ipv4 minimale pour plage adresse
       <IpServerDNS> : adresse Ipv4 du serveur DNS

3 Configuration du routeur

Pour notre infrastructure, un seul routeur est utile. Les réseaux virtuels sont créées dans note interface proxmox, lors de la configuration des machines virtuelles.

```
#!/bin/bash

if [[ $# -ne 1 ]];
then
cat <<DOC</pre>
```

```
Ce script est utiliser pour configurer les VLANS du
          routeur
